Reference for Anton Kühr – Prototyping and Concepting Internship – 04/2026

To whom it may concern,

Anton Kühr joined Furhat Robotics in April 2025 as an Intern in the Prototyping and Concepting team within our Research and Development department. Following his internship, he continued working with us while completing his Bachelor's thesis in collaboration with Furhat Robotics.

During his time with us, Anton contributed to a broad range of robotics and product-development projects involving mechanical design, electronics, software integration, and rapid prototyping. His work included developing an additional degree of freedom for the Furhat robot, building demonstrations for new software interfaces, developing product concepts, and supporting the integration and troubleshooting of robotic systems. His formal internship also involved CAD, 3D printing, microcontroller and servo control, as well as programming in Python, Kotlin, Java, and C/C++.

For his Bachelor's thesis, Anton investigated Furhat's microphone implementation and developed an improved mechanical design for the internal microphone system. He combined research, prototyping, automated experimental testing, and statistical evaluation, demonstrating that he was able to approach a complex engineering problem systematically and independently. His prototype achieved a measurable and statistically significant improvement in speech-recognition performance.

Anton proved to be a versatile and dependable engineer who worked effectively across hardware and software. He approached unfamiliar problems with curiosity and persistence, communicated clearly with colleagues, and required little supervision to make meaningful progress. He was a reliable team member, and his contributions to our prototyping, system integration, and product-development work were highly appreciated.

I am pleased to recommend Anton for future positions in robotics and engineering and am confident that he will bring the same initiative, technical breadth, and hands-on approach to his future work.

Sincerely,

Nicholas Pugin
R&D Engineer
